

# Discussion Prompts

## **1. Accuracy & Realism**

- Do the triggers for STST or Staging (e.g., high current velocity, low energy, high stress) feel biologically reasonable?
- Does it make sense that fish might rest more in certain areas or times due to hydrodynamics, salinity stress, or thermal stress?

## **2. Outputs of Interest**

- Which outputs are most useful for identifying critical habitat or management actions (e.g., resting hotspot maps, resting duration, overlap of these spots with contamination)?
- Is it more helpful to track where fish rest or how long they remain in those states?
